Reduce Your Cancer Risk

1. Chart your family history of cancer, and share it with your doctor.

2. Eat colorful fruits and vegetables often — many contain cancer-fighting antioxidants.

3. Limit fatty foods such as red meat, fried foods and high-fat dairy products.

4. Exercise at a level that raises your heart rate (brisk walking, cycling, swimming) for at least 30 minutes most days.

5. Lose weight if you need to: Obesity and physical inactivity are considered risk factors.

6. Get the screenings recommended for your personal needs.

7. Watch for skin changes: Look for changes in color, texture or appearance of spots or moles. Examine monthly.

8. If you drink, keep alcohol to a minimum (no more than 1 per day for women, or 2 per day for men).

9. If you use tobacco, set a quit date; get help from your health care provider; and find emotional support to help you stay the course.

10. Block the sun’s harmful rays: Use minimum SPF of 15 (30 or higher for more protection), and limit exposure between 10 a.m. and 3 p.m.
